Annotated Sample Findings Report

See how a Single SKU Review turns conflicting product documents into a prioritized correction brief.

Fictional training example | Test Food LLC | Test Vanilla Protein Shake

WHAT THIS SHOWS

A concise executive status, evidence-based mismatch findings, prioritized corrections, and a documented review boundary - without exposing a customer's confidential source files.

This public sample is based on a fictional test submission. Private Drive links and customer-upload locations have been removed. RecallGuard flags possible mismatches for qualified human review; it does not certify compliance or replace regulatory, legal, or food-safety professionals.

1. Decision-ready executive summary

BUYER VALUE

The first page answers the operational question quickly: release, correct, or hold? Teams can escalate the right SKU without reading every source document first.

Reference ID	RGI-SAMPLE-001
Company	Test Food LLC (fictional)
Product	Test Vanilla Protein Shake
SKU	VP-1002
Review status	HOLD - PRODUCT IDENTITY MISMATCH
Production readiness	Not ready based on submitted materials. Manual correction and qualified review are recommended before release.

IDENTITY	INGREDIENTS	ALLERGENS	FILE QUALITY
Review required	Review required	Review required	No automated issue detected

Why the SKU was held

The submitted product name described a vanilla protein shake, while the uploaded label and formula/spec materials described a chicken salad product. Ingredient and allergen signals therefore could not be reconciled safely to the submitted SKU.

NOT A BLACK BOX

Each status is tied to visible evidence and a recommended next action. The customer can see why the item was flagged and what document needs correction.

2. Evidence-based findings

Product identity mismatch

HOLD-LEVEL

Evidence	Submitted product: Test Vanilla Protein Shake. Uploaded label and formula/spec: Chicken Salad, with a different SKU identity.
Recommended action	Confirm the uploaded label and formula/spec belong to VP-1002. Replace the incorrect files or correct the submitted product identity before release.

Ingredient inconsistency

REVIEW REQUIRED

Evidence	Submitted statement listed water, milk, vanilla, and sugar. Uploaded materials contained chicken, mayonnaise, eggs, nonfat dry milk, celery, salt, and spices.
Recommended action	Compare the final label statement to the approved formula/spec. Update the label or provide the correct formula/spec document.

Possible undeclared allergen signal

REVIEW REQUIRED

Evidence	Uploaded materials contained an egg signal, while the submitted allergen statement declared milk only.
Recommended action	Confirm allergen presence using the approved formula and supplier documentation. Correct the declaration and artwork if egg is present.

TRACEABLE REVIEW

The production report can retain source-document references privately. This public sample intentionally removes storage URLs and customer file locations.

3. Prioritized correction brief

A useful findings report should not stop at 'mismatch detected.' It should give the customer a practical sequence for correcting the submission.

1	Confirm product identity Verify that the product name, SKU, label artwork, formula/spec, and uploaded files all refer to the same product.
2	Reconcile ingredients Compare the final label ingredient statement against the approved formula/spec and supplier documentation.
3	Resolve allergens Confirm every allergen signal and update the declaration and artwork when applicable.
4	Submit corrected files Replace the mismatched source documents and retain revision history for traceability.
5	Complete qualified approval Have the corrected package reviewed under the company's established QA, regulatory, legal, and food-safety controls.

CLEAR SCOPE

RecallGuard provides OCR-assisted and rule-based findings from submitted materials. It does not approve labels, certify compliance, provide legal advice, or replace qualified professional review.

Check one SKU before it becomes an expensive correction.
